

The Agentic Solution Accelerator

Powered by the Canonical Layer Framework & Cortex Code

A REFERENCE ARCHITECTURE BRIEF FOR ENTERPRISE DEPLOYMENTS

The Onboarding Bottleneck: Escaping the Bespoke Rebuild

The Old Way

Re-model, re-write SQL, re-build the app against each new schema.

Per-customer effort

A human reverse-engineers the source by hand.

Who does the mapping

Exported or copied to a fragile demo environment.

Data Movement

A one-off demo that cannot be certified or re-run.

Output

The Agentic Accelerator

Approve an agent-proposed mapping – 3 conformance tables.

An agent profiles the estate and proposes it; a human reviews.

Stays entirely in the customer's account (0 rows moved).

A certified, versioned, re-runnable derived data product and app.

The Grand Thesis: Two Engines, One Seam

2 Engines

1 Canonical Logical Contract

3 Conformance Tables

0 Rows of Data Moved

Engine 1: Agentic Discovery & Onboarding

Adapting to the unknown without writing a single line of code.

Phase 1: Discover

Point Cortex Code at a Snowflake account. A profiler agent scores candidate columns by name, type, grain, and value-shape.

Phase 2: Propose

The agent writes mapping suggestions into three conformance tables.

The Crucial Constraint (Governed AI):

 The agent **builds nothing**.

 The agent **invents nothing**.

 It **never guesses silently**—every row starts its lifecycle **explicitly** tagged as **PROPOSED**.

The Airlock: The Canonical Logical Contract

A 100% physical-agnostic domain ontology in four parts.

Objects (26 Business Entities)

Includes grain and a “powers” capability field (e.g., SURVEY_RESPONSE, FACILITY_UNIT).
8 required, 18 optional.

Relationships (19 Canonical Joins)

Defines cardinality and link-kind.
Never references physical tables.

Elements (~115 Atomic Fields)

Typed fields (Structured/Unstructured) that belong to objects.
Unstructured routes natively into AI pipelines.

Vocabulary (Canonical Value Sets)

Shared semantic tags (TOPBOX, FLAG) utilized by the data layer, ML models, agent, and application.

Key Insight: Graceful Degradation

The contract documents its own failure modes. Missing an optional object?
The application automatically degrades visually, but the core system still ships.

The Execution Seam: Three Conformance Tables

The entire customer-specific surface is mapped, not migrated.

The Readiness Gate

Humans promote **PROPOSED** mappings to **APPROVED**. Nothing builds until a pre-flight check deterministically proves every required template binds perfectly.

Engine 2: Deterministic Delivery

Once the gate passes, creativity ends and **pure engineering** takes over.

The Mechanics (Phases 3 & 4)

- ✓ **Pure Render:** The renderer expands templates bound to the approved contract.
- ✓ **Idempotent Deploy:** Creates every object OR REPLACE in exact dependency order.
- ✓ **No Hand-Authored DDL:** The customer never sees a template or writes SQL. Same template, any schema, zero edits.

The Result: A reliable, promotable, version-controlled artifact—not a fragile, cloned demo.

The Payload: The Certified Derived Product

A Native AI Tier

Unstructured elements route natively into Cortex AISQL voice enrichment (sentiment, AI_TRANSCRIBE) and custom headless XGBoost risk models with SHAP.

The AI is native, not bolted on.

Composability

Because each accelerator publishes a fixed-shape output, they act as inputs for the next.
Example: Patient Experience reuses voice themes from a distinct Extraction accelerator. Reuse, don't rebuild.

The Delivery Vehicle: Delivered as a Cortex Code Plugin

Turning a bespoke consulting solution into a distributable software factory.

```
$ install github:<org>/<repo>#<branch>
> installing plugin...
```

Skills

The 4 phases mapped as auto-discovered slash commands.

Agents

The read-only conformance-mapper.

Assets

The contract, Jinja templates, XGBoost notebooks, and Next.js app.

The Beauty of the Framework

The entire system is installed from a Git source and driven entirely by one per-customer config.json. It upgrades in place and can be promoted to a governed artifact library.

An agentic solution accelerator is not a demo you clone. It is an agent that onboards a customer's data estate into a Canonical Logical Contract, plus a engine that renders a certified, composable derived data product and app on their own data.

Zero Data Movement

Safe by Construction

Infinitely Repeatable
